

We go deeper now in the theoretical part, using the philosophical part as the foundation. This second layer will help us to understand to whom the laws and regulations are addressed, and by whom they're conceived, what tools are employed, what values animate them.

Rigorous knowledge precisely because many branches of knowledge what is like to be a human being in the net. We have human science (anthropology, etc.) vs ? Frequently this narratives, although they're valid in their field, they end up offering us a partial vision incapable of capturing the changes due to this new form of existence.

Philosophy is situated "upstream" of all these specific forms of knowledge about the phenomenon. It aims to bring to light those radical questions that are overlooked as they'r taken for granted, clarified and established.

By redirecting attention to aspects that remain hidden, we are engaged in a complex work of reconstruction of the meanings, values that undelies ??

In 1927, Heidegger described what means to be a dasein, that is a being aware of his own existence. He adopts a phenomenological perspective, pointing out the existential structure of dasein that we have already examined.

Phenomenology is that method of philosophical inquire based on observing a phenomenon and describing it, interpreting it as it appears.

Dasein, when he is on the Net, he does not simply appear, his being online is not the result of a necessary condition in which he finds himself, beyond his will (like being in the world). We can indicate a first peculiarity: dasein does not just appear on the net, he exposes himself. He exposes himself to others. The observer must take into account this mediation that stands between observation and what is observed.

On the net, we do not simply exist, but we must connect. There is no being on the net apart from this exposure. To be in the net is to expose ourselves. The term "exposure", seen from an hermeneutical point of view, it can be understood as "exporre", to bring out, but on the other hand this exposure is the result of a deliberate staging choice by those who are being exposed, unlike in the shared world in which others are always before me, online we can know about an other dasein, only through what he chooses to expose. To continue to exist online, we must expose ourselves, so publish our private life, preferences, opinions, image. The core of exposure can only be understood from the awareness that every act of exposure corresponds to an act of concealment. This consists in what remains private, withdrawn from the public gaze.

No matter how intense our exposure may be, there will always be moments lived away from the gaze of others.

Our view of others and ourselves does not end where the private sphere beings. There is not a limit between public and private, it's all blended up, but what I don't want to reveal about me. In general, what we do not want to expose?

Anything that could hurt the image of ourselves, like defeats, difficult moments, etc.

In doing so, we present ourselves as goods, just like they're displayed in a supermarket shell. This is also exposure. We are not in the gratuitness of relating to others, but by using their attention to draw them into our net. This interplay of exposure and concealment returns to us a fragmented and inauthentic vision of others. The other appears in a version that is altered by their own mediation, a filtered image. The other in latin is "Alter". We have then the word "altered alter", which is another one that has been modified in his presentation, which is not straightforward but staged, filtered by his mediation. Online, being together with others (mit-sein), becomes equivalent to consuming their content. Thus, the mode of being online is not that of simply being in the world, which may also include the deficient mode of doing nothing, but that of performance. Each performance content has the effect of stripping the experience of others present from our existential horizon, and consequently distancing us from them and ourselves. This form of virtual society does not grant us direct access to the knowledge of others, but forces us to ? the projection that everyone makes of themselves. The concept of projection can be understood in the cinematic sense, as the film that dasein projects of himself online, where he is at once actor, protagonist, actor and producer. Being in the world, by entering in the net, he is relived from the commitment of having to develop its own existential project. Instead, dasein seeks refugee in an identitarian projection, specifically designed for the others. In one hand we have the project, that is oriented towards ourselves, and has to be something concrete. Differently, a projection is oriented toward others, and is not about realizing something, rather displaying something. Why do we expose ourselves online to others rather than for ourselves? Social medias based on performance are built around Heidegger existential of commisurating comparison. Heidegger means that the relationships are structured through the process of distinction, opposition, levelling or denial of difference. In other words, the everyday being with others is ruled by subjection to others, shaped by the admiration/envy dimension for others, and guilt/shame for ourselves. On one hand we have admiration, which can easily turn into envy. They both share the idea of "watching", but while the former is a more respectful form, the latter is more

"evil".

The silent approval of the likes replace the qualitative argumentation, so that only what is numerically relevant comes. When I press the "heart", I don't explain why, as for somebody publishing a content he is not interested about "why" you like it. Dasein online is not what it is, but what he seems. Appearance is seen as "semblance", it is not necessary to realize a concrete project to provoke admiration and envy in others, we just need to project an identity that appears as we wish to be seen. In this sense, the media, even when it aims to present reality in its immediacy, it provides an interpretation and mediation. The word "immediato" means "no mediation". But even if social medias claims to present facts, they're just interpretation of facts, therefor having a double mediation of the phenomenon online. The immediacy of experience encountered in presence does not coincide with the instantaneity of consumption offered by the digital medium.

Let's revise Heidegger existential structure in the "age of the algorithmic power". The first one we've seen is being in the world, "in der welt sein". We have another dimension that we live nowadays, "in der web sein". The world that is understood not merely as a geographical place, but above all the place we build the network of meanings and practical reference that each of us inherit at birth. To inhabit the world means to experience it, that is to understand in practice through familiarity habits, knowledge and elaborate strategies. This means coming into "con-tact", with the world, things, tools, and with others who inhabit it, this is the way we become familiar with them (??). It's experiencing physically, not just mentally. In fact, when we were toddlers we didn't know that water is H_2O , we experience it by drinking it, coming into contact.

The sense, as we've seen, are the channels through which this exchange happens, known as "um-gang", which means exchange but also manipulation.

Virtual relationships have replaced contact with "connection". Through connection, thinking about the senses through which we experience the world, are limited to those that can function across spacial and temporal distance, like sight and hearing. Online, we have almost infinite possibilities to see and hear through a screen.

In the distance imposed by connection, we must do without touch, taste and smell, senses that require physical presence and direct experience. To inhabit the net, therefore, means to know the world by renouncing three out of 5 senses, the same ones that contribute to shape our knowledge, and orient us in the search of meanings.

Now comes "thrownness", the "geworfenheit", the second existential. It is referred to the unavoidable and finit condition where each of us has been casted without

asking it and choosing it. It would be improper to extend the same concept to our being online, since no one has literally thrown us into the net.

Essendo lanciati in questo mondo digitalizzato, non siamo lanciati anche nei social network?

The sense of disorientation of ruthlessness and lostness does not diminish. Let's ask ourselves, what is a net?

Let's consider the acrobat. For them, the net is a safety device protecting them from falling into the void. For us, too, the network was salvific, for example during the pandemic, where "contact" took the meaning of "contagion". "Contact" and "contagion" has, indeed, the same root. The net could be seen as a salvation device. However, beyond its beneficial aspect, we must consider it's unsettling dimension. The net is not only a tool of salvation, but is also a tool of capture. Let's think of the fisherman. As we say that every action performed online leaves a trace, the idea of leaving traces belongs to a scenario of predators and prey. On one hand, there are a few large companies (predators), that through surveillance take over user data. In the other hand, users, who are defendless, must expose themselves in order to inhabit the platforms, surrounding data.

E la gente che non posta niente per esempio? E osserva solo?

User seems to be digital preys. There is the concept of "clickbait", as an hook of dragging attention to the bait. It uses psicological and emotional trigger to capture and maintain the user attention.

Moreover, just as fisherman chooses bait depending on the type of fish they want to catch, content creators identify target audiences. This requires studying of preferences, understanding behaviours, and anticipating motivations.

In the digital world, this is achieved through algorithms.

In fishing, the goal could only not only to catch the fish, but keep it alive for later consumption. Similarly, in the digital world, to keep us engaged we're constantly offered new forms of bait, stimulating us emotionally.

We can clarify the form that throwness takes when online: the perception of inhabiting a dimension not entirely controllable, and where it's impossible to develop genuine familiarity.

Being online is not only an alternative way of being in the world, but it's also something that is profoundly alterative because it alters the structure. For example, we should ask ourselves how our understanding of space and time have changed. The society shaped by the digital revolution is characterized by the progressive erosion of duration (time), rootedness (space). In the net, time

fragments into a subsession of isolated ?, suspended in the present, and disconnected from a stable temporal horizon. At the same time, space becomes neutralized in a platform, losing existential relevance, and existing in ?

A platform has a flatness, and within this everything that stands out, exists, that is relevant, loses the existential relevance and exists only if we're in the net. In this context, the creation of virtual identities fragments the self into increasingly automated forms, becoming fluid identities, disposed into digital forms of alteregos without face, origin or direction.

Heidegger formula possibility is higher than reality. Virtual reality appears as the place where humans can realize infinite identities, without truly inhabiting any of them. In this context, the only temporal dimension that survives is the present, reduced to the visible talk of contingency, so what is out an horizon. We have chronology, that is a form of time that we dispose. We don't follow the natural flow of time. Time, when it's emptied of duration, becomes merely a connection between one now and another now, then once another. All of these "now" are not connected, but fragmented.

In the interval where nothing happens, boredom emerges.

This form of times discourages the contemplative lingering. Our democracy, with "demos" having the power ("cratos"), becomes dromocracy, with "dromos" being "speed". In this age, acceleration becomes a strategy to overcome the limits of human life. Those living at double speed can realize double as many possibilities.

Modern technology also seeks to eliminate distance. The internet dissolves geography. The individual loses any sense of rootedness. The anxiety generated by these deterritorialized space, is qualitative different from Heidegger's anguish. For Heidegger existence becomes authentic when shaped from the awareness of finitude, while in contemporary society, where speech has generated into chatter, it lost its authentic function (??).

The virtual spaces that we inhabit are proved inadequate to satisfy our need of relationships.
