

The umgang, often translated as commerce, more properly indicates the exchange of meanings taking place between myself and others, and myself and entities. This exchange, however, does not occur on a merely cognitive level, nor it precede from a scientific knowledge. I don't relate to others in terms of calculations, rather I come into familiarity with them through this process.

Coming into contact with things and others structure our experience of the world. It is precisely the encounter with what is radically different that arouse wonder and disorientation, leading to something that contributes to form our identity and uniqueness.

Experiencing the world means to expose ourselves, to the real to which human beings did not adapt to, but rather adapting the environment to themselves. This forms the passage from the welt to the umwelt. This process takes the name of zu nehmen, which means "to take", and is connected to the world "name". Taking a naming share the intention of acquiring something, so that it may be used later. The totality of the reality, in order to manageable, and not generate panic, is fragmented into names and individuated into things.

Given the totality, we name things and take them in order to fragment the reality in a way it can be understandable to us.

In a system defined as techno-capitalist, the network has produces a fusion of technology, economy and science, mutually imposing upon others. Economy invests in what science indicates, to refine technology, and technology? The fundamental law of technology is the one of self-implementation, so technology follows a strictly performative logic, pursuing as its primary goal the increase of efficiency, through the progressive elimination of disfunctional parts.

Then, technology aims not only to increase efficiency, but also to increase speed, which means to eliminate all those empty intervals between heavens (??), preventing thought from reconsidering them. At this point, velocity becomes voracity, consuming time like any other commodity, and leading democracies to the accelerated tempo of dromocracy.

To eliminate waiting, delays, empty times, technology seeks to abolish distance, making everything readily available and at hand. Our digital bestand given by social networks etc. are full of people that disappear and are transformed into data and profiles, arranged in the gestell.

To look somebodies profile, is not to see someone in their "tridimensionality" (?), as well as seeing only what they allow what appears, and not their totality.

To complete the picture of the values animating technology, there is the pursuit of

the transparency. We have already encountered the stereotypical society, which is something fixed, and this is the form of society that is the expression of what "in der welt sein" is, instead of being in the world (welt). Every action, in order to be transparent, must be translated into an information. Yet, they flow rapidly. Information is oriented forward, frenetically projected itself towards what is new. Information accumulates without expressing an overall meaning, without getting a pause. Narrative, by contrast, composes different voices, like those of a chorus. Information bombards us, leaving only a background of noise, known as "infonoise". This abundance of information does not make us wiser, rather more dispersed among different possibilities.

In this society, where everything must be reduced to information, truth coincides with transparency. We've seen how truth appears by revealing herself, where at times she hides herself in the pit, some others appears (??).

Truth is something that calls us to movement and transformation. In this struggle between seeming and beginning to be, truth cannot be total illumination, which rather than clarifying, ends up blinding us. It's excessive illumination that produces blindness, this form of transparency. The word "transparency" comes from "trans spicio", which means "to see through", so being able to see through something, where there are no visual boundaries between inside and outside. So it seems to be a characteristic of an observed object, rather it regards the observers. To be on the net is not enough to simply exist. Online, exposure to others' gaze, does not occur through fortuitous being together. To appear online, one must be "showy", the digital self becomes a showy being, transforming its presence into a performance. We produce counterfeit copies of ourselves, overlaying our image with aesthetics and filters, exposing ourselves as commodities are exposed on a shelf. Identity becomes a product. If we consider influencers channel, we can see how popularity no longer belongs primarily to flawless profile, that are boring, but those that evokes more empathy, and engagement through a presumed authenticity, that is however inauthentic.

We have also a side of compassion capitalism, and we start to understand how economy and capitalism enables this system, taking also the name of "charity porn???", where vulnerability becomes a form of entertainment and profit. We also have pain capitalism, where suffering is normalised, exposed by others.

What about their dignity? The authentic care for others (the rucksicht)?

There is no real overcoming of issues through acts of normalization, as discomfort and illness becomes a source of approval, and profit. Yet, having many views is not the same as feeling seen. Seeing another is different from consuming their content. Heavens no longer set the tempos (??), with not having an horizon, but bubbles of

reality.

Consider how digital performance has changed. On the one hand, content is consumed rapidly, but on the other hand the performance also consists in showing oneself studying, and interacting with the use every thirty minutes (ex). In this context, the need for connection emerges, especially in the absence of contact.

The result is an hyperinvaded solitude, or an hyperisolate multitude.

Traditionality also produces anonymity, as we've seen with the dictatorship of man, but in that there was at least an ideology in which one could identify itself. Thus, the digital mass composed of users combines anonymity with the absence of ideology.

The only ideology is individual desire, achieved without any manual effort.

We've seen how being in the world alters our relation with ourselves and others, now we see how it alters our perception of things.

Our exchange with the world does not concern only people, but also things.

How do networks change our relation with things? Rather than possessing things, we want experiences. Rather than owning things, we want access to them, without establishing bonds (concept related also to people). Binding to people becomes an ineffective behaviour, as it limits the possibility of experience (and freedom) in the consumeristic sense.

We thus have temporary access to networks and platforms, weakening identification of things. Possession implies stability and a relation with things, establishing their values. Things are the anchors linking us to those who came before us. The value of a beloved object is inestimable, disconnected from its price (the market value). Yet, we can observe that even this form of bond has been changed by platforms, leading to get rid of our memories (like through Vinted). To remember, which in Latin means "recordare", means to maintain a bond with the past. The past, however, must be set aside to leave space to new future experiences. The market system, to function correctly, must rid itself from emotionality of objects, binding them to people. The symbolic value of an object is flattened in an exchange value. Possession involves using something, giving a "meaning" to an object. Without the tactile element constituting of every relationships, bonds do not emerge.

Where the industrial capitalism that is rooted in the society of prototypes transformed matter into commodities, technocapitalism transformed the immaterial into commodities. We went from matter to immaterial being sold as a merch. The difference between culture as "cultus", binding people around values, and market, becomes seemingly to each other (??). Communities disperse in many virtual communities, that becoming commodities cease to exist.

The world object is derived from "ob-iacere", so something that stays in our way, in front of me. Originally, objects were something opposing a resistance to me. Digital objects have a total different nature, lacking the negativity of "obiacere". The surface of screens and devices combines in a sense of polish, and the absence of resistance. Things in the world become dosein ??. Everthing becomes available and ready to hand. This absence of resistance leads to a deficiency of word, of authentic and immediate experience, as our screen increasingly becomes windows, through which we look through to see and understand the world. However, through them we don't see the world directly, but a mediation produced by the media. Here, no physical contact occurs, and reality is stripped of people presence, and perception loses its bodily part. It is no longer human senses grasp reality, but machinic sensors. Yet, as Heidegger noted, the human relation to things is not secondary, but a structural moment of creating and building his identity. Let's think about a small child. For him, things enable a safe experience of reality. Objects that are touched serve the function as bridges between the self of the child and environment. Objects become irreplaceable. Through transitional objects, children experience their relation with alterity. Objects they touch are soft and fluffy.

Today children increasingly interacts with devices, that unlike other objects do not promote foster relation with others, but it's a narcissistic object. Devices are smooth, hard and cold object. This discourages the manipulation, and in touching them the child does not find safety and refuge, while playing through a transitional object allows the child imagination to flood. Smartphones, flood imagination with stimuli, fragmenting attention and destabilising their minds. The narcissistic object requiring only tapping renders superfluous any manual activity. Through smartphones, we perceive ourselves and exclude others. We withdraw into bubbles protected by others, shielding ourselves.

We've observed the *zuhandenheit* and the *vorhandenheit*. We've seen also how we experience reality, that is not anymore through our hands, but through our fingers, so we can talk about "zufingerheit" ("a portata di dito").

We lose three senses out of five, and we lose also our fingers.
